perception and cognition are tightly related as our primary mode of contact with the world perception is the informational and causal foundation of our cognitive processes it is fundamental to our empirical thinking believing and action planning traditional accounts of the mind consider perception and cognition to be distinct yet highly interrelated systems much interdisciplinary empirical and theoretical work from cognitive scientists and philosophers has attempted to elucidate the complex relations holding among these systems suggesting the existence not only of influences of perception on cognition but also vice versa however many questions are left unanswered given that perception is a guide to our thinking about and acting upon the world appropriately the two systems must be able to talk to one another information carried by perception must be of a form adequate to be taken in by our various cognitive systems the question arises what kinds of structural similarities must hold between perceptual and cognitive representations for such communication to be possible and how exactly do perceptual and cognitive representations interact some researchers have argued that the links between perception and cognition are so tight as to instill doubt as to the significance of the distinction between the two systems in the first place yet others insist that perception and cognition remain distinct the aim of this research topic is to deepen our understanding of the kinds of interaction among perception and cognition and of the nature of the representational structures that would enable such interaction provided by publisher
